Chapter 1

Introduction

Over the last 20 years there was a major leap in robotics, especially in the field of quadrupeds. Many great papers developing the domain were published. And most of the researching work was done in labs, requiring great means for prototyping and pushing the boundaries of the domain. In this paper, I would like to review the research and practical achivements that have been done throughout the years and combine it in a project, the cost of which will be less. The idea is to establish a base for low-cost quadruped robots to make them more affortable for day-to-day use in different fields of human lives.

1.1 Literature review

Chapter 2

Methodology

2.1 Methods and technologies used

2.1.1 Project requirements

2.1.2 Technologies selection

2.1.3 Models

Chapter 3

Results

Chapter 4

Conclusion

Chapter 5

Future work
